# Q. Dijkstra's Algorithm

Given this directed graph, run Dijkstra's Algo to find shortest paths starting from **source node A**. Give the node visit order, and fill in this table of SN (Shortest Distance) and PN (Previous Node), crossing out old SD and PN as you find a shortcut path with smaller SD

Visit Order

| Node | SD | PN |
|------|----|----|
| A    |    |    |
| B    |    |    |
| C    |    |    |
| D    |    |    |
| E    |    |    |
| F    |    |    |
| G    |    |    |

# Q. Dijkstra's Algorithm

Visit Order

| Node | SD       | PN |
|------|----------|----|
| A    | $\infty$ |    |
| B    | $\infty$ |    |
| C    | $\infty$ |    |
| D    | $\infty$ |    |
| E    | $\infty$ |    |
| F    | $\infty$ |    |
| G    | $\infty$ |    |

# Q. Dijkstra's Algorithm

Visit Order

A

| Node | SD       | PN |
|------|----------|----|
| A    | 0        | /  |
| B    | $\infty$ |    |
| C    | 2        | A  |
| D    | 1        | A  |
| E    | $\infty$ |    |
| F    | $\infty$ |    |
| G    | $\infty$ |    |

# Q. Dijkstra's Algorithm

Visit Order

A, D

We can choose to visit either C or E next, since they have equal smallest SD of 2 among all unvisited nodes. Let's visit C in alphabetical order

| Node | SD | PN |
|------|----|----|
| A    | 0  | /  |
| B    | 6  | D  |
| C    | 2  | A  |
| D    | 1  | A  |
| E    | 2  | D  |
| F    | 7  | D  |
| G    | 6  | D  |

# Q. Dijkstra's Algorithm

Visit Order  
A, D, C

| Node | SD             | PN             |

# Q. Johnson's algorithm

Consider the following weighted digraph. As part of Johnson's algorithm for All-pairs Shortest Paths, add a dummy source node  $d$ , and edges with weight 0 from  $d$  to all vertices of  $G$ . Let the modified graph be  $G'$ .

a) Compute the shortest distances from dummy source node  $d$  to each node in  $G'$  by hand:  $h[0]$ ,  $h[1]$ , ..  $h[V-1]$ , then reweight the edges of the original graph to make the edge weights greater than or equal to 0. Draw the reweighted graph  $G'$  (without the dummy node  $d$ ).

b) For the reweighted graph  $G'$ : run Dijkstra's Algo to find shortest paths starting from **source node 1**, and compute the shortest paths for the graph with updated positive or zero weights. (Do not show the intermediate steps.)

c) For the original graph  $G$ : compute the shortest paths starting from **source node 1** with negative weights.

Original graph

Reweighted graph

| Node | SD' | PN |
|------|-----|----|
| 1    | 0   | /  |
| 2    |     |    |
| 3    |     |    |
| 4    |     |    |

Shortest paths starting from source node 1 in reweighted graph

| Node | SD | PN |
|------|----|----|
| 1    | 0  | /  |
| 2    |    |    |
| 3    |    |    |
| 4    |    |    |

Shortest paths starting from source node 1 in original graph

# Q. Johnson's algorithm ANS (a)(b)

Shortest distances from dummy source node  $d$ :  $h[1]=0$ ,  $h[2]=-2$ ,  $h[3]=0$ ,  $h[4]=-1$ .  
(Theoretically you should run Bellman-Ford algorithm starting from node  $d$ , but the graph is simple enough that you can obtain the  $h[]$  values by observation.)

Using  $w'(u, v) = w(u, v) + h[u] - h[v]$ , we have:  $w'[1][2] = -2 + 0 - (-2) = 0$ ,  $w'[1][3] = -1 + 0 - (-1) = 0$ ,  $w'[3][2] = 1 + 0 - (-2) = 3$ ,  $w'[3][4] = -1 + 0 - (-1) = 0$

# Q. Johnson's algorithm ANS (c)

- Let's run Dijkstra's algorithm starting from source node 0, and obtain the shortest paths table for the reweighted graph
- We then subtract  $h[s] - h[t]$  from length of each shortest path from s to t to obtain the shortest paths table for the original graph (PN stays the same)
  - $SD(2)=0-(0-(-2))=-2$
  - $SD(3)=1-(0-0)=1$
  - $SD(4)=1-(0-(-1))=0$

Reweighted graph

| Node | $h()$ |
|------|-------|
| 1    | 0     |
| 2    | -2    |
| 3    | 0     |
| 4    | -1    |

| Node | $SD'$ | PN |
|------|-------|----|
| 1    | 0     | /  |
| 2    | 0     | 1  |
| 3    | 1     | 1  |
| 4    | 1     | 3  |
